# **VOC Emissions from Building Products**

Customer & Building Product Sample Information			
Report Certification			
Report number	225-016-01A-Sep0822		
Report date	Sep 8, 2022		
Certified by (Name/Title)	Raja S. Tannous, Laboratory Director		
Signature	Japs, Ja		
Date	September 8, 2022		
Standards			
Test method	CDPH/EHLB/Standard Method V1.2 (Sect. 01350)		
Acceptance criteria	CDPH/EHLB/Standard Method V1.2		
Modeling scenario(s)	CDPH/EHLB/Standard Method V1.2 Standard Classroom & Office		
Product type	Wallcoverings – HWPW Panel		
Customer Information			
Manufacturer or organization	Columbia Forest Products		
City/State/Country	Klamath Falls, OR USA		
Contact name/Title	Paul Davis, Program manager		
Phone number	503-243-7311		
Product Sample Information*			
Manufacturer (if not customer)	Same as above		
Product name / Number	PureBond HWPW with Collins Pine FreeForm NAF PB Core		
Product CSI category	Wood Paneling (06 42 00)		
Customer sample ID	not provided		
Manufacturing location	Columbia Plywood Corporation, Klamath Falls, OR		
Date sample manufactured	Aug 9, 2022		
Date sample collected	Aug 10, 2022		
Date sample shipped	Aug 10, 2022		
Date sample received by lab	Aug 11, 2022		
Condition of received sample	No observed problems		
Lab sample tracking number	225-016-01A		
Conditioning start date & duration	Aug 12, 2022; 10 days		
Chamber test start date & duration	Aug 22, 2022; 4 days (96 hours)		
Total test start date & duration	Aug 12, 2022; 14 days (336 hours)		

\*Chain-of-custody (COC) form for product sample is attached to this report

### Conformity Assessment – CDPH VOC Concentration Criteria

**VOC Emission Test Results** – The product sample was tested for emissions of VOCs following California Department of Public Health CDPH/EHLB/Standard Method Version 1.2, 2017. The chamber test results were modeled to one or more scenario(s) defined in CDPH Standard Method V1.2. The modeled indoor VOC concentrations then were compared to the acceptance criteria defined in CDPH Standard Method V1.2 to determine compliance of the product sample to the standard. The modeling scenario(s) are detailed in Table 3, and the predicted indoor VOC concentrations at 336 hours are given in Table 6 of this report. The allowable concentrations used as acceptance criteria are reproduced in Appendix B of this report. Table 1 summarizes the pass/fail results based on the predicted indoor air concentrations of individual VOCs of concern in the modeled scenario(s).

**Decision Rule** – The decision rule is defined in CDPH Standard Method V1.2. Compliance to the standard is determined based on the estimated indoor air concentrations of individual VOCs at 336 hours for the modeling scenario(s) without consideration of measurement uncertainty.

**TVOC Concentration Range** – USGBC's LEED v4 rating systems for buildings include a requirement for reporting of the predicted TVOC concentration in one of three range categories, i.e.,  $\leq 0.5 \text{ mg/m}^3$ ,  $>0.5 \text{ to } 4.9 \text{ mg/m}^3$ , and  $\geq 5.0 \text{ mg/m}^3$ . Table 1 includes the TVOC concentration range in the modeled scenario(s).

Chemical	CAS No	Allowable Concentration		oncentration /Fail)
		(µg/m³)	Classroom	Office
Acetaldehyde	75-07-0	70	Pass	Pass
2-Propanol (Isopropyl alcohol)	67-63-0	3500	Pass	Pass
TVOCª			≤ 0.5 mg/m <sup>3</sup>	≤ 0.5 mg/m <sup>3</sup>

 Table 1. Pass/Fail results based on the test method and identified modeling scenarios. Only detected individual

 VOCs with defined acceptance criteria are listed. The TVOC concentration range also is shown

<sup>a</sup> Reporting of TVOC range is for information only; TVOC is not a Pass/Fail criterion

## *Test Method for Building Product Samples*

**Test Specimen Preparation** – We cut a specimen from received plywood panel sample, placed it on a stainless steel plate, and sealed all four edges with aluminum tape. The calculated exposed area is based on the top surface of 17.7cm\*17.7cm. Photographs of the tested specimen are shown later in this report. The test results presented herein are specific to this item.

Test Protocol Summary\* – This VOC emission test was performed following California Department of Public Health CDPH/EHLB/Standard Method Version 1.2, 2017. This version of the standard is identical to CDPH/EHLB/Standard Method V1.1, 2010 except that the benzene allowable concentration is lower. Note: this standard derives from California architectural Specification 01350 and frequently is referred to as "Section 01350." The chamber test prescribed in the standard follows the guidance of <u>ASTM Standard Guide D5116</u>. Chemical sampling and analyses were performed following U.S. EPA Compendium Method TO-17 and ASTM Standard Method D5197. The product specimen was prepared from the supplied product sample and was placed directly into the conditioning environment and maintained at controlled conditions of air flow rate, temperature and relative humidity for ten days. At the end of this period, the specimen was transferred directly to a small-scale chamber. The chamber conditions for the 96-h test period are summarized in Table 2. Air samples were collected from the chamber at 24 h, 48 h and 96 h elapsed time. Samples for the analysis of individual VOCs and TVOC were collected on multisorbent tubes containing Tenax-TA backed by a carbonaceous sorbent. Samples for the analysis of low molecular weight aldehydes were collected on treated DNPH cartridges. VOC samples were analyzed by thermal desorption GC/MS. TVOC was calculated using toluene as the calibration reference. Individual VOCs (iVOCs) were quantified using multi-point (4 or more points) with calibration curves prepared with pure standards, unless otherwise noted. iVOCs without pure standards were quantified based on their total-ion-current responses using toluene as the calibration reference. Formaldehyde and acetaldehyde were analyzed by HPLC and quantified using multi-point (4 or more points) calibration curves. The analytical instruments and their operating parameters are described in Appendix A.

**Exception(s)** and **Deviation(s)** – 1) For ASTM D5197 analysis of carbonyl compounds, DNPH cartridges are extracted into 2-mL volumetric vials instead of 5-mL volumetric flasks. This deviation has no impact on the results.

**Measurement Uncertainty (MU)** – Combined relative standard deviations (RSDs) have been estimated by propagation of error for the measurement of area-specific emission rates of 35 iVOCs plus formaldehyde and acetaldehyde in small- and mid-scale chambers. These RSDs are within a range of 3.4 – 29% with median and average values of 12% and 14%, respectively. Expanded MU equals 2 x RSD.

**Disclaimer** – The sample was collected by the customer or by a third party. The results are specific to this test item as received from the customer.

**Availability of Data** – All data, including but not limited to raw instrument files, calibration files, and quality control checks used to generate the test results will be made available to the customer upon request subject to Berkeley Analytical's Services Agreement.

<sup>\*</sup>All standards identified in this section are included in Berkeley Analytical's scope of ISO/IEC17025 accreditation, Testing Laboratory TL-383, International Accreditation Service, www.iasonline.org

# Test Method for Building Product Samples, Continued

#### Table 2. Chamber conditions for test period

Parameter	Symbol	Units	Value
Tested specimen exposed area	As	m²	0.031
Chamber volume	Vc	m <sup>3</sup>	0.067
Loading ratio	L	m²/m³	0.468
Avg. Inlet gas flow rate & Range	Qc	m³/h	0.067 (0.064-0.070)
Avg Temperature & Range		°C	23.3 (22-24)
Avg Relative humidity & Range		%	49 (45-55)
Duration		h	96

#### Modeling Parameters for Building Products

**Modeling Parameters** – CDPH/EHLB/Standard Method Version 1.2 describes the modeling procedures and parameters for estimating the impact of VOC emissions from a building product on indoor air concentrations in a standard classroom and a standard office space. The dimensions and ventilation of the spaces and the exposed surface areas of major materials are prescribed. The modeling scenario(s) and parameters applicable to this test are listed in Table 3.

Table 3. Parameters used for estimating VOC air concentrations at 336 hours for the modeling scenarios

Parameter	Symbol	Units	Value	
Falameter	Symbol		Classroom	Office
Product exposed area	A <sub>PB</sub>	m <sup>2</sup>	94.6	33.4
Building volume	VB	m <sup>3</sup>	231	30.6
Floor/Ceiling Area	A <sub>B</sub>	m²	89.2	11.15
Ceiling height	H <sub>B</sub>	m	2.59	2.74
Outdoor air (OA) flow rate	QB	m³/h	191	20.7
Area-specific air flow rate	qA	m³/m²-h	2.02	0.62

## VOC Emission Test Results

**Chamber Background Concentrations** – Background concentrations measured at time zero are reported in Table 4. The background concentrations of TVOC, formaldehyde, acetaldehyde, and reported iVOCs are listed.

Chemical/Chemical Group	CAS No	Chamber Conc (μg/m <sup>3</sup> )
Acetaldehyde	75-07-0	LQ
Formaldehyde	50-00-0	LQ
TVOC		LQ

**Table 4**. Chamber background VOC concentrations at time zero

**Emitted VOCs** – Individual VOCs (iVOCs) detected in the test and present above the lower limits of quantitation in chamber air are reported in Table 5. All iVOCs with CRELs and/or on other lists of toxicants of concern are listed first. Next, all frequently occurring iVOCs with pure standard calibrations are listed. Additionally, the 10 most abundant iVOCs quantified using toluene as the reference standard are listed; identifications of these compounds are considered tentative. Reporting of fewer than 10 iVOCs indicates that fewer than 10 chemicals met these criteria.

Chemical	CAS No	Surrogate?*	CREL (µg/m <sup>3</sup> )	CARB TAC Category	Prop 65 List?
Acetaldehyde	75-07-0		140	T-lla	Yes
2-Propanol (Isopropyl alcohol)	67-63-0		7000	T-IIb	
1-Butanol	71-36-3			T-IVb	
Ethanol	64-17-5				
2-Propanone (acetone)	67-64-1				
Pentanal	110-62-3				
(+/-)-alpha-Pinene	80-56-8				
(-)-beta-Pinene	18172-67-3				
3-Carene	13466-78-9				
d-Limonene	5989-27-5				
Acetic acid	64-19-7	Yes			
Hexanal	66-25-1	Yes			
1,3,5-Cycloheptatriene, 3,7,7- trimethyl-	3479-89-8	Yes			

Table 5. Listed and abundant iVOCs detected above lower limits of quantitation in 96-h air sample

\*"Yes" response indicates iVOC quantified using toluene as the calibration reference; all other iVOCs quantified using pure standards

### VOC Emission Test Results, Continued

**VOC Emission Factors and Estimated Indoor Air Concentrations** – The 96-h chamber sample was analyzed for iVOCs including formaldehyde and acetaldehyde. The emission factors for iVOCs presented in Table 6 were calculated from the chamber parameters, the exposed area of the test specimen and the measured 96-h chamber concentrations corrected for any chamber background concentrations. The emission factors were used to predict the indoor air concentrations of iVOCs for the modeling scenario(s) applicable to this test as shown in Table 3. See Equations for calculation methods.

Chemical	Chamber Emission Concentration Factor			Air Concentration /m <sup>3</sup> )
	(µg/m³)	(µg/m²-h)	Classroom	Office
Acetaldehyde	19.4	41.6	20.6	67.3
Ethanol	4.6	9.9	4.9	16.0
2-Propanone (acetone)	35.3	75.9	37.6	123
2-Propanol (Isopropyl alcohol)	2.6	5.7	2.8	9.2
Acetic acid	3.2	6.9	3.4	11.1
1-Butanol	4.1	8.8	4.3	14.2
Pentanal	5.2	11.1	5.5	18.0
Hexanal	10.6	22.8	11.3	36.8
(+/-)-alpha-Pinene	9.0	19.4	9.6	31.3
1,3,5-Cycloheptatriene, 3,7,7- trimethyl-	3.1	6.6	3.3	10.7
(-)-beta-Pinene	10.1	21.6	10.7	34.9
3-Carene	13.0	28.0	13.9	45.2
d-Limonene	3.5	7.4	3.7	12.0

**Table 6.** Measured chamber concentrations at 96 h, calculated emission factors, and estimated indoor air concentrations of individual VOCs for the modeling scenarios

### VOC Emission Test Results, Continued

**Quality Measurements** – Chamber samples collected at 24, 48 and 96 hours were analyzed for total VOCs (TVOC). Because the TVOC response per unit mass of a chemical is highly dependent upon the specific mixture of iVOCs, the measurement of TVOC is semi-quantitative. TVOC primarily is used as a quality measure to determine if the VOC emissions from a product are relatively constant or generally declining over the test period. Some programs may require the reporting of predicted indoor air TVOC concentrations or concentration ranges in mg/m<sup>3</sup>. TVOC emission factors and predicted TVOC concentrations are shown in Table 7. Aldehyde samples collected at 24, 48 and 96 hours were analyzed for formaldehyde as another quality measure. Formaldehyde emission factors are shown in Table 8. Product claims related to formaldehyde content may be based, in part, on formaldehyde emission factors.

 Table 7. TVOC chamber concentrations at 24, 48, and 96 h with corresponding emission factors and predicted indoor air concentrations (mg/m<sup>3</sup>)

Elapsed Time	Chamber Concentration	Emission Factor	Estimated Indoor A (mg/r	
(h)	(µg/m³)	(µg/m²-h)	Classroom	Office
24	98	211	0.104	0.341
48	94	201	0.099	0.325
96	75	161	0.079	0.260

Table 8. Formaldehyde chamber concentrations at 24, 48, and 96 h with corresponding emission factors

Elapsed Time (h)	Chamber Concentration (μg/m³)	Emission Factor (µg/m²-h)
24	LQ	LQ
48	LQ	LQ
96	LQ	LQ

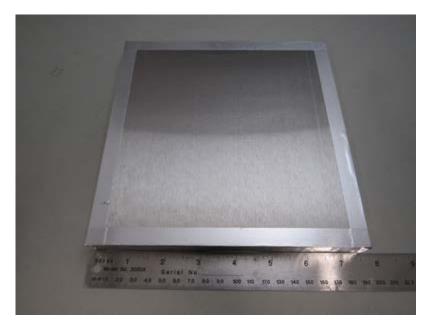

# Photographs of Tested Product Specimen

**Photo Documentation** – The product sample specimen is photographed immediately following specimen preparation and prior to initiating the conditioning period. Typically, the top and bottom faces of the specimen are photographed. Bottom faces may show a stainless-steel plate or other substrate if prescribed by the standard.

# Definitions, Equations, and Comments

#### **Table 9**. Definitions of parameters

Parameter/Value	Definition
CARB TAC	Toxic Air Contaminant (TAC) on California Air Resources Board list, with toxic category indicated
CAS No.	Chemical Abstract Service registry number providing unique chemical ID
Chamber Conc.	Measured chamber VOC concentration at time point minus any analytical blank or background concentration for empty chamber measured prior to test. Lower limit of quantitation (LQ) or reporting limit for individual VOCs is 2 µg/m <sup>3</sup> unless otherwise noted
Indoor Air Conc.	Estimated indoor air concentration in standard modeled environment calculated from the emission factors from test results and the modeling parameters in Table 3 using the equations given below
CREL	Chronic non-cancer Reference Exposure Level established by Cal/EPA OEHHA (http://www.OEHHA.ca.gov/air/allrels.html)
Emission Factor	Mass of compound emitted per unit area per hour (calculation shown below). Reporting limits for emission factors are established by LQ or reporting limit for chamber concentration and specimen area tested
Formaldehyde & acetaldehyde	Volatile aldehydes quantified by HPLC following ASTM Standard Method D5197. LQs for formaldehyde and acetaldehyde are 1 µg/m <sup>3</sup> and 1.4 µg/m <sup>3</sup> , respectively
Individual VOCs	Quantified by thermal desorption GC/MS following EPA Method TO-17. Compounds quantified using multi-point calibrations prepared with pure chemicals unless otherwise indicated. VOCs with chronic RELs are listed first, followed by other TAC and Prop. 65 compounds. Additional abundant VOCs at or above reporting limit of 2 µg/m <sup>3</sup> are listed last
LQ	Indicates calculated value is below its lower limit of quantitation
Prop 65 list	"Yes" indicates the compound is a chemical known to cause cancer or reproductive toxicity according to California Safe Drinking Water Toxic Enforcement Act of 1986 (Proposition 65)
тиос	Total Volatile Organic Compounds eluting over retention time range bounded by n-pentane and n-heptadecane and quantified by GC/MS TIC method using toluene as calibration reference. LQ for TVOC is 20 μg/m <sup>3</sup>
"na"	Not applicable
"<"	Less than value established by LQ

**Equations Used in Calculations** – An emission factor (EF) in  $\mu$ g/m<sup>2</sup>-h for a chemical in a chamber test of a building product sample is calculated using Equation 1:

$$EF = (Q_c (C - C_o)) / A_s$$
 (1)

where  $Q_c$  is the chamber inlet air flow rate (m<sup>3</sup>/h), C is the VOC chamber concentration ( $\mu g/m^3$ ), C<sub>0</sub> is the corresponding chamber background VOC concentration ( $\mu g/m^3$ ), and A<sub>s</sub> is the tested specimen exposed area (m<sup>2</sup>).

## Definitions, Equations, and Comments, Continued

The indoor air concentration (C<sub>B</sub>) for the modeled space in  $\mu g/m^3$  is estimated using Equation 2 and the parameters defined in Table 3:

$$C_{B} = (EF \times A_{P_{B}}) / Q_{B}$$
(2)

where  $A_{P_B}$  is the exposed area of the product in the building (m<sup>2</sup>) and  $Q_B$  is the outside air flow rate (m<sup>3</sup>/h).

Comments: None.

### Appendix A Analytical Instruments & Operating Parameters

**Table A1**. Description of analytical instrument components

Component	Description
HPLC	1260 Infinity Quaternary LC, G1314F VW Detector, Agilent
Analytical column	Poroshell 120 EC-C18, Agilent
Column dimensions	2.1 mm x 100 mm
Thermal desorber	Unity / TD100, Markes International, Ltd.
Gas chromatograph	Model 7890A, Agilent
Analytical column	DB-624, J&W Scientific
Column dimensions	1 μm film, 0.18 mm ID, 20 m
Mass spectrometer	Model 5975C MSD, Agilent

Table A2. HPLC operating parameters for analysis of formaldehyde and acetaldehyde

Parameter	Value
Solvent A	65/35% H <sub>2</sub> O/Acetonitrile
Solvent B	100% Acetonitrile
Flow rate	0.3 mL/min
End time	11 min
Detector wavelength	360 nm

 Table A3.
 Thermal desorption GC/MS parameters used for analysis of iVOCs and TVOC

Parameter	Value
Thermal desorption	
Tube desorb temperature	300 °C
Trap temperature	-5 °C
Trap desorb temperature	300 °C
Trap desorb split ratio	10:1
Gas chromatograph	
Initial temperature	40 °C
Initial temperature time	6.0 min
Final temperature	300 °C
Final temperature time	2 min
Mass spectrometer	
Low scan mass, <i>m/z</i>	30 amu
High scan mass, <i>m/z</i>	450 amu
Scan rate	3.42 Hz
